

Understanding Indents

Indents are important in python. You indent code to place it inside an if or a loop.

```
from mckPy import *  
  
while running():  
    fill("skyblue")  
  
    drawRect("red", x, 100, 50, 100, outline = 2)  
    if overRect(x, 100, 50, 100):  
        drawRect("plum", x, 100, 50, 100, outline = 2)
```

this drawRect is indented twice, once for the while loop, once for the if. It is inside both

fill, drawRect and if are inside while loop.

Common Mistakes

No Indent

When you use an if or a loop, you must apply this to a block of code. That block must be indented. In this simple case, the fill must be indented.

```
page = "intro"  
while running():  
    if page == "intro":  
        fill("skyblue")
```

Off By One Space

All lines in the same block must be at the same indent level. Here the second if is indented one too many spaces.

```
page = "intro"  
while running():  
    fill("skyblue")  
  
    drawRect("red", x, 100, 50, 100, outline = 2)  
    if overRect(x, 100, 50, 100):  
        drawRect("plum", x, 100, 50, 100, outline = 2)  
    if clickOnRect(x, 100, 50, 100):  
        page = "game"
```
